

Walk-based methods to investigate networks II

Ernesto Estrada

University of Strathclyde, Glasgow, UK

Abstract

I will continue with the concept of walk of networks and study the concept of bipartivity on networks. I will show how to quantify the 'degree of bipartivity' of a non-bipartite network. I will also introduce the concept of spectral scaling and how to classify networks uniquely into four structural classes. The lecture is based on a combination of mathematical results and examples of applications.
