

Walk-based methods to investigate networks I

Ernesto Estrada

University of Strathclyde, Glasgow, UK

Abstract

I will introduce some of the basic concepts for studying networks using walks (not random walks). I will introduce the concept of walk-based centrality and prove that the eigenvector centrality and Katz index are based on walks on graphs. I will then introduce the concept of subgraph centrality and communicability in networks. The lecture is based on a combination of mathematical results and examples of applications.
