

# **Development of novel word acquisition paradigm for non-invasive brain stimulation studies**

Anna A. Zhuravleva

Ekaterina A. Stupina

Svetlana A. Malyutina, Ph.D.

Center for Language and Brain, National Research University Higher School of Economics

# Non-invasive brain stimulation & Language processing

- Can non-invasive brain stimulation modulate language processing in healthy individuals?
- Task performance often **at ceiling**
- > insensitive to any stimulation effects
- **Need for challenging language tasks** that would be sensitive to stimulation effects

# Methods and materials

## Stimuli:

- 80 pseudowords (Stupina & Chrabaszcz, 2020)
- 80 L1 stimuli (Akinina et al., 2014)
- Stimuli: [link](#)

## Pseudowords examples:

aderu  
bokente  
enkadu  
favatu  
kampibu  
mugalu  
pentave  
takuru

## L1 stimuli examples:

самолет ('airplane')  
шприц ('syringe')  
одуванчик ('dandelion')  
свисток ('whistle')  
наперсток ('thimble')  
аквариум ('aquarium')  
колбаса ('sausage')  
стрела ('arrow')

## Day 1

### Acquisition 1:

- presentation
- 3-Alternative-Forced-Choice task
- Recall

### Immediate test 1

- Recognition
- Recall
- Semantic decision

## Day 2

### Delayed test 1

- Recognition
- Recall
- Semantic decision

## Day 3

### Acquisition 2:

- presentation
- 3-Alternative-Forced-Choice task
- Recall

### Immediate test 2

- Recognition
- Recall
- Semantic decision

### Delayed test 2

- Recognition
- Recall
- Semantic decision

# Online validation

- Participants acquired novel word forms **enough to recognize** them, but still were **unable to reproduce** them properly
- Overall participants' performance **improved in the delayed testing** phase: novel words have become partially consolidated
- Participants performed well in most of the tasks, and still their performance was not at ceiling and could be potentially improved

# Discussion

- The current paradigm **matches an optimal difficulty level** of the planned experiment and **can be adapted for other studies** on novel word acquisition
